EXAMINER'S AMENDMENT

An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it MUST be submitted no later than the payment of the issue fee.

This application is in condition for allowance except for the presence of claims 4-7 to inventions non-elected without traverse. Accordingly, claims 4-7 have been cancelled.

The application has also been amended as follows:

Change claim 3 recitation "method of claim 3" to read --method of claim 1--.

Allowable Subject Matter

Claims 1-3 allowed.

The following is an examiner's statement of reasons for allowance:

The closest prior art of Hawbaker et al. (US Patent 6,604,420) discloses a vibratory horn used to produce cavitation (and consequent insonification) at a coated surface. Erosion of the coating indicates poor adhesion (abstract).

The related prior art however does not disclose or fairly suggest plotting erosion time of the coating versus cavitation (or insonification) pressure nor determining a maximum instantaneous erosion pressure based on the plot as in the instant invention.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably

accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

Drawings

The drawings filed on 03/19/2004 are acceptable subject to correction of the informalities indicated on the attached "Notice of Draftsperson's Patent Drawing Review," PTO-948. In order to avoid abandonment of this application, correction is required in reply to the Office action. The correction will not be held in abeyance.

Conclusion

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

Edwards et al. (US Patent 5,045,007) teaches applying ultrasonic energy to a container to produce cavitation of a solution, thereby increasing the efficiency of the solution to remove a coating from the surface of a mask.

Kumar (US Patent 4,501,768) teaches a mechanism of film removal in ultrasonic cleaning involving the rupturing of a loose metal film from substrate areas by the action of the shock waves impinging on the surfaces. The shock waves being induced by bubble collapse (cavitation) within the liquid medium during the ultrasonic action.
